| Formato                 | Materiale a stampa   |
| Livello bibliografico   | Monografia   |
| Nota di contenuto       | Chapter 1: New trends on bio-cementation and self-healing testing --<br>Chapter 2: Testing durability on construction materials -- Chapter 3:<br>Innovative durability tests on construction materials.  |
| Sommario/riassunto      | This book presents the most recent advances on testing and<br>experimentation in civil engineering, especially in the branches of<br>materials, structures, and buildings, complementing the authors'<br>publication Advances on Testing and Experimentation in Civil<br>Engineering - Geotechnics, Transportation, Hydraulics and Natural<br>Resources. It includes advances in physical modelling, monitoring<br>techniques, data acquisition and analysis, and provides an invaluable<br>contribution to the installation of new civil engineering experimental<br>facilities. The first part of the book covers the latest advances in the<br>testing and experimentation of key domains of materials, such as bio-<br>cementation and self-healing, durability, and recycled materials, as well<br>as the new environmental requirements related to the presence of |

hazardous substances in construction materials. Furthermore, laboratory and in situ tests, together with equipment needed to estimate the behaviour and durability of construction materials are presented, updating the most important technological advances. The second part of the book highlights the relevance of testing and monitoring in structures, including in situ tests related to static load tests, dynamic tests, and long-term monitoring strategies, as well as laboratory tests of adhesive joints. Experimental tests on shake tables and blast-resistant structures are also described. Recent applications of drone technologies for the inspection and monitoring of civil structures are another important theme developed. Finally, in its third part, the book presents new developments in the characterisation of building testing, with the support of modelling, to assess building pathology and new requirements, acoustic comfort, fire safety, visual comfort, and energy consumption.
