Sommario/riassunto	IEEE Std 1680-2006 provides a set of environmental performance criteria for notebook computers, desktop computers, and computer monitors. In addition, it defines the methods by which manufacturers may declare such products as conforming with the Standard and by which such conformance may be verified. The Standard provides a measure of environmental leadership in product design, manufacture, service and end-of-life management. It is intended for use by institutional purchasers to select personal computer products, and by product manufacturers who wish to sell such products. There are three levels of conformance with this Standard.
