Sommario/riassunto

The biopsychosocial study of Arab Americans yields compelling insights into innovative theoretical and applied initiatives. In the context of a growing population of Arab Americans, coupled with the current tenure of xenophobia and exposed structural racism in the US, clinical and community practitioners must be attuned to their clients of Arab ancestry, whose experiences, development, and health concerns are distinctly different than that of their White counterparts. This second edition, with its uniquely interwoven sections of culture, psychosocial development, and health and disease, provides a rich overview of timely, critical topics. The audience for the text includes counselors, social workers, psychologists, nurses, psychiatrists, sociologists, and any other public and mental health practitioners, researchers, and policy makers who work with and on behalf of clients and patients of Arab descent. The authors represent a team of leading experts spanning disciplines of sociology, clinical mental health, and community public health. .
