

1. Record Nr.	UNINA9910741156403321
Autore	Puglisi Andrea
Titolo	Transport and Fluctuations in Granular Fluids : From Boltzmann Equation to Hydrodynamics, Diffusion and Motor Effects // by Andrea Puglisi
Pubbl/distr/stampa	Cham : , : Springer International Publishing : , : Imprint : Springer, , 2015
ISBN	3-319-10286-9
Edizione	[1st ed. 2015.]
Descrizione fisica	1 online resource (131 p.)
Collana	SpringerBriefs in Physics, , 2191-5423
Disciplina	530 530.15 530.41 621
Soggetti	Amorphous substances Complex fluids Statistical physics Dynamics Physics Soft and Granular Matter, Complex Fluids and Microfluidics Complex Systems Mathematical Methods in Physics Statistical Physics and Dynamical Systems
Lingua di pubblicazione	Inglese
Formato	Materiale a stampa
Livello bibliografico	Monografia
Note generali	Description based upon print version of record.
Nota di bibliografia	Includes bibliographical references and index.
Nota di contenuto	Introduction -- 1 Granular fluids: from everyday life to the lab -- Boltzmann equation: a gas of grains -- Hydrodynamics: a sea of grains -- Tracer's diffusion: swimming through the grains -- The arrow of time: past and future of grains -- Conclusion and perspectives -- Expansion of the first two moments of the transition rates for large mass of the tracer -- Index.
Sommario/riassunto	This brief offers a concise presentation of granular fluids from the point of view of non-equilibrium statistical physics. The emphasis is on fluctuations, which can be large in granular fluids due to the small

system size (the number of grains is many orders of magnitude smaller than in molecular fluids). Firstly, readers will be introduced to the most intriguing experiments on fluidized granular fluids. Then granular fluid theory, which goes through increasing levels of coarse-graining and emerging collective phenomena, is described. Problems and questions are initially posed at the level of kinetic theory, which describes particle densities in full or reduced phase-space. Some answers become clear through hydrodynamics, which describes the evolution of slowly evolving fields. Granular fluctuating hydrodynamics, which builds a bridge to the most recent results in non-equilibrium statistical mechanics, is also introduced. Further and more interesting answers come when the dynamics of a massive intruder are discussed. Such non-equilibrium stochastic process offers a more precise and compact picture of the features foreseen at the more detailed levels of description. The dynamics of an intruder diffusing in a granular fluid reveal the clearest connection with recent theories on stochastic energetics and stochastic thermodynamics.
