1.	Record Nr.	UNINA9910746969503321
	Autore	Gessner Tobias R
	Titolo	Integrated Modeling of Reservoir Fluid Properties and Multiphase Flow in Offshore Production Systems / / by Tobias R. Gessner, Jader R. Barbosa Jr
	Pubbl/distr/stampa	Cham : , : Springer International Publishing : , : Imprint : Springer, , 2023
	ISBN	3-031-39850-5
	Edizione	[1st ed. 2023.]
	Descrizione fisica	1 online resource (296 pages)
	Collana	Petroleum Engineering, , 2366-2654
	Altri autori (Persone)	Barbosa JrJader R
	Disciplina	622.33827
	Soggetti	Cogeneration of electric power and heat
		Fossil fuels
		Underground construction
		Fluid mechanics
		Sedimentology
		Mining engineering
		Fossil Fuel
		Underground Engineering and Tunnel Construction
		Engineering Fluid Dynamics
		Mining and Exploration
	Lingua di pubblicazione	Inglese
	Formato	Materiale a stampa
	Livello bibliografico	Monografia
	Nota di contenuto	Chapter 1. Introduction -- Chapter 2. Thermodynamics of petroleum mixtures -- Chapter 3. Developing a fluid model -- Chapter 4. Fluid flow in oil production systems -- Chapter 5. Simulation of offshore production systems -- Chapter 6. Improving the fluid flow model -- Chapter 7. Concluding remarks -- Appendix.
	Sommario/riassunto	The book is intended for practicing engineers in the oil industry, researchers, and graduate students interested in designing and simulating offshore hydrocarbon production systems. It approaches offshore oil production systems from an integrated perspective that combines the modeling of thermophysical properties of reservoir fluids and their flow as a multiphase mixture in wellbores, flow lines, and risers. The first part of the book presents an internally consistent

method to compute the critical parameters and acentric factor of Single Carbon Number (SCN) fractions of petroleum mixtures using state-of-the-art multivariate fitting techniques. The procedure is illustrated and validated using flash and differential liberation data from actual field samples. In the second part of the book, mechanistic multiphase flow models are discussed in light of their ability to predict the pressure, temperature, and phase holdup of production fluids in wellbores, flow lines, and risers. Multivariate fitting procedures are again applied to evaluate the sensitivity of the results with respect to closure relationship parameters, such as slug body gas holdup, wall shear stress, and wall roughness in pipelines and production tubing. Finally, the modeling framework is validated using actual field data from offshore production wells.
