Sommario/riassunto	This monograph presents the author's studies in music recognition aimed at developing a computer system for automatic notation of performed music. The performance of such a system is supposed to be similar to that of speech recognition systems: acoustical data at the input and music scoreprinting at the output. The approach to pattern recognition employed is that of artificial perception, based on self-organizing input data in order to segregate patterns before their identification by artificial intelligencemethods. The special merit of the approach is that it finds optimal representations of data instead of directly recognizing patterns.

Sommario/riassunto

How were ideas and experiences of transformation expressed in early Christianity and early Judaism? This volume explores the social and philosophical frameworks within which transformative ideas such as resurrection and practices of becoming "a new being" were shaped. It also explores the analogies and parameters by which transformation was being observed, noted and asserted. The focus on transformation helps to connect topics that tend to be studied separately, such as cosmology, resurrection, aging, gender, and conversion. The textual material is wide-ranging and there are new readings
