	Sommario/riassunto	In the US, private ownership of land is not a new idea, yet the federal government retains title to roughly a quarter of the nation's land, including national parks, forests, & wildlife refuges. Managing these properties is expensive & contentious, & few management decisions escape criticism. Some observers, however, argue that such criticism is largely misdirected. The fundamental problem, in their view, is collective ownership & its solution is privatization. A free market, they claim, directs privately owned resources to their most productive uses, & privatizing public lands would create a free market in their services. This timely study critically examines these issues, arguing that there is no sense of 'productivity' for which it is true that greater productivity is both desirable & a likely consequence of privatizing public lands or 'marketizing' their management.

Sommario/riassunto	"The articles compiled in this volume offer new insights into the wealth of prosodic and syntactic phenomena involved in the encoding of information structure categories. They present data from languages which are rarely, if ever, taken into account in the most prominent approaches in information structure theory, and which belong to the Afroasiatic, Amerindian, Australian, Caucasian, and Niger-Congo language stocks. In addition to the significant descriptive value of these pioneering contributions, several studies also draw attention to previously undescribed or typologically rare phenomena. By adapting a variety of methods to under-described and endangered languages, ranging from experimental to naturalistic corpus studies, this volume also aims to serve as an invitation for further research in this direction" --
