1. Record Nr. UNINA9910779222103321

Autore	Holland John H (John Henry), <1929-2015.>
Titolo	Signals and boundaries : building blocks for complex adaptive systems / / John H. Holland
Pubbl/distr/stampa	Cambridge, Mass., : MIT Press, ©2012 ©2012
ISBN	0-262-30497-X 1-282-13381-0 9786613806390 0-262-30589-5
Descrizione fisica	1 online resource (317 p.)
Disciplina	003
Soggetti	Adaptive control systems Adaptation (Biology) - Mathematical models Signals and signaling - Mathematical models
Lingua di pubblicazione	Inglese
Formato	Materiale a stampa
Livello bibliografico	Monografia
Note generali	Description based upon print version of record.
Nota di bibliografia	Includes bibliographical references and index.
Nota di contenuto	Contents; Preface; 1 The Roles of Signals and Boundaries; 2 Theory and Models: General Principles; 3 Agents and Signal Processing; 4 Networks and Flows; 5 Adaptation; 6 Recombination and Reproduction; 7 Urn Models of Boundaries; 8 Boundary Hierarchies; 9 The Evolution of Niches-A First Look; 10 Language: Grammars and Niches; 11 Grammars as Finitely Generated Systems; 12 An Overarching Signal/Boundary Framework; 13 A Dynamic Generated System Model of Ontogeny; 14 A Complete Dynamic Generated System for Signal/Boundary Studies; 15 Mathematical Models of Generated Structures 16 A Short Version of the WholeReferences; Index
Sommario/riassunto	Complex adaptive systems (cas), including ecosystems, governments, biological cells, and markets, are characterized by intricate hierarchical arrangements of boundaries and signals. In ecosystems, for example, niches act as semi-permeable boundaries, and smells and visual patterns serve as signals; governments have departmental hierarchies with memoranda acting as signals; and so it is with other cas. Despite a

wealth of data and descriptions concerning different cas, there remain many unanswered questions about "steering" these systems. In Signals and Boundaries, John Holland argues that understanding the origin of the intricate signal/border hierarchies of these systems is the key to answering such questions. He develops an overarching framework for comparing and steering cas through the mechanisms that generate their signal/boundary hierarchies. Holland lays out a path for developing the framework that emphasizes agents, niches, theory, and mathematical models. He discusses, among other topics, theory construction; signal-processing agents; networks as representations of signal/boundary interaction; adaptation; recombination and reproduction; the use of tagged urn models (adapted from elementary probability theory) to represent boundary hierarchies; finitely generated systems as a way to tie the models examined into a single framework; the framework itself, illustrated by a simple finitely generated version of the development of a multi-celled organism; and Markov processes.
