Sommario/riassunto

This is the second biennial volume reviewing the state-of-the-art on a wide variety of micro and macro health care management topics in the popular "Advances in Health Care Management" series. It proudly showcases reviews of both empirical and conceptual research in specific areas of health care management, including topics in three basic areas: reviews of empirical and conceptual research on health care industry-specific topics, e.g., role of physicians; reviews of empirical and conceptual research on different types of health care organizations focusing on issues specific to such organizations or their segments of the health care industry, e.g., hospitals, managed care organizations; and, reviews of empirical and conceptual research on health care organizations focusing on topics or variables which cover various sub-disciplines of management, e.g., organizational change or entrepreneurial opportunity recognition. New and established scholars discuss such topics within their expert area of research, as well as emerging themes and divergent views, giving their unique perspective on the directions that will help build theory and improve the practice of health care management.

Sommario/riassunto	Partial differential equations of mixed elliptic-hyperbolic type arise in diverse areas of physics and geometry, including fluid and plasma dynamics, optics, cosmology, traffic engineering, projective geometry, geometric variational theory, and the theory of isometric embeddings. And yet even the linear theory of these equations is at a very early stage. This text examines various Dirichlet problems that can be formulated for Keldysh-type equations, one of the two main classes of linear elliptic-hyperbolic equations. Open boundary conditions (in which data are prescribed on only part of the boundary) and closed boundary conditions (in which data are prescribed on the entire boundary) are both considered. Emphasis is placed on the formulation of boundary conditions for which solutions can be shown to exist in an appropriate function space, and specific applications to plasma physics, optics, and analysis on projective spaces are discussed.
