Classificazione	COM051010
Disciplina	415.01/51
Soggetti	Grammar, Comparative and general - Mathematical models
	Unification grammar
	Lexical-functional grammar
	Head-driven phrase structure grammar
Lingua di pubblicazione	Inglese
Formato	Materiale a stampa
Livello bibliografico	Monografia
Note generali	Title from publisher's bibliographic system (viewed on 05 Oct 2015).
Nota di bibliografia	Includes bibliographical references (p. 299-305) and index.
Nota di contenuto	1. Introduction; 2. Feature structures; 3. Unification; 4. Unification grammars; 5. Linguistic applications; 6. Computational aspects of unification grammars; 7. Conclusion; Appendixes.
Sommario/riassunto	Grammars of natural languages can be expressed as mathematical objects, similar to computer programs. Such a formal presentation of grammars facilitates mathematical reasoning with grammars (and the languages they denote), as well as computational implementation of grammar processors. This book presents one of the most commonly used grammatical formalisms, Unification Grammars, which underlies contemporary linguistic theories such as Lexical-Functional Grammar (LFG) and Head-driven Phrase Structure Grammar (HPSG). The book

provides a robust and rigorous exposition of the formalism that is both mathematically well-founded and linguistically motivated. While the material is presented formally, and much of the text is mathematically oriented, a core chapter of the book addresses linguistic applications and the implementation of several linguistic insights in unification grammars. Dozens of examples and numerous exercises (many with solutions) illustrate key points. Graduate students and researchers in both computer science and linguistics will find this book a valuable resource.
