Sommario/riassunto	This book provides a comprehensive analysis of the economic value of Mediterranean forests, including not only the more obvious benefits (e. g. timber), but also the less commonly-measured public goods (e.g. tourism and conservation) that these forests provide. It brings together forest valuations at the national level from eighteen Mediterranean countries, based on extensive local data collection, and thus allows comprehensive analyses within countries as well as comparative

analyses across countries. Forest benefits were classified within the Total Economic Value (TEV) framework.
