	Sommario/riassunto	IBM Tivoli License Manager is a new IBM product that fills a growing need to reconcile software licenses that are already in use in an organization, with the licenses owned by the organization. It offers a technical way to control and apply the software vendors' pre-defined licensing policies. It allows the Administrator to easily manage different products in different ways, reflecting the rules of each products license agreement. The primary objective of this IBM Redbooks publication is to introduce the new IBM offering for designing and creating a license management solution, and it is targeted at the technical professional responsible for providing license management services in an IT organization. It can be used as a reference book for the deployment of IBM Tivoli License Manager Version 1.1, guiding you during the planning, installation, configuration, administration, tuning, and general product usage phases - focusing on how to effectively deploy this product in a way that quickly generates real business value for customers. This book is a valuable addition to the existing product documentation and should be read in conjunction with the official product documentation, which complements the concepts explained in this book.
