   Sommario/riassunto IBM Tivoli Intelligent ThinkDynamic Orchestrator and IBM Tivoli
                       Provisioning Manager automate the traditional manual provisioning
                       process, performance measurement, capacity planning, and
                       infrastructure deployment. IBM Tivoli Intelligent ThinkDynamic
                       Orchestrator operates in a closed loop that performs automatic
                       resource-requirements prediction based on predefined service level
                       objectives and agreements, and automates infrastructure deployment.
                       This just-in-time cycle ensures that each application has the resource
                       it needs, when it needs it--without static overprovisioning. This book is
                       targeted at a diverse audience but is mainly geared toward the
                       technical professional (consultants, IT architects, and IT specialists)
                       responsible for providing quality services in an IT organization. It can
                       be used as reference upon the deployment of IBM Tivoli Intelligent
                       ThinkDynamic Orchestrator and IBM Tivoli Provisioning Manager
                       guiding throughout the planning, installation, configuration, general
                       usage, and troubleshooting phases, with focus on effective deployment
                       of these products in a way that quickly generates real business value
                       for customers. Please note that the additional material referenced in
                       the text is not available from IBM.
