The Changing Profile of Counterparty Risk in the United States; IV. The Adverse Impact of Counterparty Risk on Global Liquidity; 2. Counterparty Liabilities of Major U.S. Banks; Tables; 1. Snapshot of Reduced Collateral Posting Among LCFIs; 2. Securities Lending by Major Custodians; V. Regulatory Thrust for a Central Counterparty; 3. Cash Holding by Major LCFIs; VI. Conclusions and Policy Implications; Appendixes 1. Methodological Issues in Computing Connectedness in Counterparty RiskReferences
Sommario/riassunto	Counterparty risk in the United States stemming from exposures to OTC derivatives payables (after netting) is now concentrated in five banks?Goldman Sachs, JPMorgan, Bank of America, Morgan Stanley and Citi. This note analyzes how such risks have shifted over the past year. We estimate that the adverse impact of counterparty risk on high-grade collateral flows and global liquidity due to decrease in rehypothecation, reduced securities lending, and hoarding of cash by major banks is at least \$5 trillion. In order to mitigate counterparty risk, there have been regulatory initiatives to establish central counterparties (CCPs). From a policy perspective, counterparty risk remains large at present and recent experience has shown that OTC derivative positions are not supported by sufficient capital, constituting a major risk for participants in this market.
