Sommario/riassunto

Computational structural mechanics (CSM) and computational fluid
 dynamics (CFD) have emerged in the last two decades as new
 disciplines combining structural mechanics and fluid dynamics with
 approximation theory, numerical analysis and computer science. Their
 use has transformed much of theoretical mechanics and abstract
 science into practical and essential tools for a multitude of
 technological developments which affect many facets of our life. This
 collection of over 40 papers provides an authoritative documentation of
 major advances in both CSM and CFD, helping to identify future directio
