Sommario/riassunto	Using language and thought to fix events in time is one of the most complex computational feats that humans perform. In the first book-length taxonomy of temporal frames of reference, Vyvyan Evans provides an overview of the role of space in structuring human representations of time. Challenging the assumption that time is

straightforwardly structured in terms of space, he shows that while space is important for temporal representation, time is nevertheless separate and distinguishable from it. Evans argues for three distinct temporal frames of reference in language and cognition and evaluates the nature of temporal reference from a cross-linguistic perspective. His central thesis is that the hallmark of temporal reference is transience, a property unique to the domain of time. This important study has implications not only for the relationship between space and time, but also for that between language and figurative thought, and the nature of linguistically-mediated meaning construction.

Sommario/riassunto	This work, which forms an important bridge between medieval and

Counter-Reformation sanctity and canonization, provides a richly contextualized analysis of the ways in which the last five candidates for sainthood before the Reformation came to be canonized.
