| Sommario/riassunto      | This book presents recent results on nonlinear evolutionary fluid<br>equations, in particular the global well-posedness and asymptotic<br>behavior of solutions to 1D radiative fluid equations, as well as liquid<br>crystal equations. Most of the material in this book was prepared by the<br>author over the past few years. This book has two main features. Firstly,<br>there are more known results on higher dimensional radiative fluid<br>systems but only on the local existence and explosion of solutions;<br>while the existing findings on the one-dimensional case present some<br>shortcomings, this book introduces corrections and improvements of<br>these shortcomings. Secondly, the current findings on the high-<br>dimensional compressible liquid crystal fluid equations are few and<br>include only globally existing solutions but not the asymptotic behavior<br>of the solutions; the author developed not only the global existence<br>and regularity of the solutions, but also the asymptotic behavior of the<br>solutions for the one-dimensional case in the chapter 3 of this book.<br>Therefore, this work provides the reader with complete elements |

related to the one-dimensional compressible liquid crystal fluid system.
