Sommario/riassunto	This book is about reading practice and experience in late medieval and early modern England. It focuses on the kinds of literatures that were more readily available to the widest spectrum of the population. Four case studies from many possibilities have been selected, each examining a particular type of popular literature under the headings 'religious', 'moral', 'practical' and 'fictional'. A key concern of the book is how we might use particular types of evidence in order to understand more about reading practice and experience, so issues of method and approach are discussed fully in the opening chapter. One distinctive

element of this book is that it attempts to uncover evidence for the reading practices and experiences of real, rather than ideal, readers, using evidence that is found within the material of a book or manuscript itself, or within the structure of a specific genre of literature. Salter attempts to negotiate a path through a set of methodological and interpretive issues in order to arrive at a better understanding of how people may have read and what they may have read. This, in turn, leads on to how we may interpret the evidence that manuscripts and early printed books provide for the ways that medieval and early modern people engaged with reading. This book will be of interest to academics and research students who study the history of reading, popular culture, literacy, manuscript and print culture, as well as to those interested more generally in medieval and early modern society and culture.

**Sommario/riassunto**

Quantum physics, in contrast to classical physics, allows non-locality and indeterminism in nature. Moreover, the role of the observer seems indispensable in quantum physics. In fact, quantum physics, unlike classical physics, suggests a metaphysics that is not physicalism (which is today's official metaphysical doctrine). As is well known, physicalism implies a reductive position in the philosophy of mind, specifically in its two core areas, the philosophy of consciousness and the philosophy of action. Quantum physics, in contrast, is compatible with psychological non-reductionism, and actually seems to support it. The essays in this book explore, from various points of view, the possibilities of basing a non-reductive philosophy of mind on quantum physics. In doing so, they not only engage with the ontological and epistemological aspects of the question but also with the neurophysiological ones.
