Sommario/riassunto

"In this Dahlem workshop report, scientists from different disciplines- including anthropology, psychology, psychiatry, and behavioral biology-come together to explore the concepts of attachment and bonding from diverse perspectives. In their studies they seek to understand the causes or the consequences of attachment and bonding in general and their different qualities in individual development in particular. They address such questions as biobehavioral processes in attachment and bonding; early social attachment and its influences on later patterns of behavior; bonding later in life; and adaptive and maladaptive (or pathological) outcomes."--Publisher's description.
