Sommario/riassunto	Ruslan Grigor'evitch Skrynnikov unfolds the drama of terror under Ivan the Terrible and his oprichnina. He uses new kinds of evidence paying close attention to primary sources. The conflicts between Ivan and the gentry, the crushing of Novgorod autonomy, the ways in which Ivan interpreted his authority and sought to create an alternative base of power in a loyal body of henchmen-followers known as the oprichnina, the alienation of different groups in society from the government, the impoverishment and weakening of whole regions leading to the Time of

Troubles are among the themes that Skrynnikov develops. The details of Ivan's confrontations with those he perceived as opponents, the forms of execution he inflicted on his enemies, the atmosphere of peril and suspicion that he created justify the description of his reign as one of terror, relevant of course to later periods of history with obvious echoes of the Stalinist period.

Sommario/riassunto	How many times have we thought with concern about the possible contamination of food? Pollution, agricultural treatments, technological treatments, and packaging are the best-known human sources of toxic substances as food contaminants. The present book contains 11 original research papers representing various approaches of identifying and measuring toxic residues in food materials. The analytical determination of food contaminants is an indispensable tool in characterizing the adverse effects and unexpected toxicity related to food intake. No risk assessment would be possible without data from the analysis of food contaminants. This Special Issue is an interesting overview of recent methods and is highly representative of a broad worldwide outline, collecting authors from ten different countries and four continents. Very different toxics are described, from volatile organic compounds to heavy metals and from highly polar chemicals to classical organic contaminants. A wide range of analytical techniques

are portrayed, including sample preparation and clean-up methodologies, classical chromatographic and hyphenated spectroscopies, and the latest high-resolution mass spectrometry applications. The presented works consider a varied selection of foods: the studied matrices are meat, fishery products, fruits, and miscellaneous beverages.
