

1. Record Nr.	UNINA9910826727303321
Autore	Welch H. Gilbert
Titolo	Should I be tested for cancer? : maybe not and here's why // H. Gilbert Welch
Pubbl/distr/stampa	Berkeley, : University of California Press, c2004
ISBN	0-520-93990-5 1-59734-896-1
Edizione	[1st ed.]
Descrizione fisica	1 online resource (236 p.)
Disciplina	616.99/4075
Soggetti	Cancer Cancer - Diagnosis Medical screening
Lingua di pubblicazione	Inglese
Formato	Materiale a stampa
Livello bibliografico	Monografia
Note generali	Description based upon print version of record.
Nota di bibliografia	Includes bibliographical references (p. 199-218) and index.
Nota di contenuto	Pt. I. Problems you should know about. -- It is unlikely that you will benefit -- You may have a "cancer scare" and face an endless cycle of testing -- You may receive unnecessary treatment -- You may find a cancer you would rather not know about -- Your pathologist may say it's cancer, while others say it's not -- Your doctor may get distracted from other issues that are more important to you -- Pt. II. Becoming a better-educated consumer -- Understand the culture of medicine (and why we are pushed to test) -- Understand the statistics of cancer (and why five-year survival is the world's most misleading number -- Understand the limits to research; even genetic research (and why it is hard to be sure there really are benefits to screening -- Develop a strategy that works for you.
Sommario/riassunto	Combining patient stories and data on common cancers, the author makes the case that testing healthy people for cancer is really a double-edged sword: tests may help, but some have little effect and are sometimes even harmful.
