Sommario/riassunto	Since the 1990's, there has been unparalleled growth in the literary output from an ever more diverse group of Latinx writers. Extant criticism, however, has yet to catch up with the diversity of writers we label Latinx and the range of themes about which they write. Little sustained scholarly attention has been paid, moreover, to the very category under which we group this literature. Latinx Literature Unbound, thus, begins with a fundamental question "What does it mean to label a work of literature or an entire corpus of literature Latinx?" From this question others emerge: What does Latinx allow or

predispose us to see, and what does it preclude us from seeing? If the grouping—which brings together a heterogeneous collection of people under a seemingly homogeneous label—tells us something meaningful, is there a poetics we can develop that would facilitate our analysis of this literature? In answering these questions, *Latinx Literature Unbound* frees Latinx literature from taken-for-granted critical assumptions about identity and theme. It argues that there may be more salubrious taxonomies than Latinx for organizing and analyzing this literature. Privileging the act of reading as a temporal, meaning-making event, Ralph E. Rodriguez argues that genre may be a more durable category for analyzing this literature and suggests new ways we might proceed with future studies of the writing we have come to identify as Latinx.

Sommario/riassunto	Woody biomass is most widely used for energy production. In the United States, roughly 2% of the energy consumed annually is generated from wood and wood-derived fuels. Woody biomass needs to be preprocessed and pretreated before it is used for energy production. Preprocessing and pretreatments improve the physical, chemical, and rheological properties, making them more suitable for feeding, handling, storage transportation, and conversion. Mechanical preprocessing technologies such as size reduction and densification, help improve particle size distribution and density. Thermal pretreatment can reduce grinding energy and torrefied ground biomass has improved sphericity, particle surface area, and particle size distribution. This book focuses on several specific topics, such as understanding how forest biomass for biofuels impacts greenhouse gas emissions; mechanical preprocessing, such as densification of forest residue biomass, to improve physical properties such as size, shape, and density; the impact of thermal pretreatment temperatures on woody biomass chemical composition, physical properties, and microstructure for thermochemical conversions such as pyrolysis and gasification; the grindability of torrefied pellets; use of wood for gasification and as a filter for tar removal; and understanding the pyrolysis kinetics of biomass using thermogravimetric analyzers.
