Sommario/riassunto

The concept of mobility has grown enormously over the last two decades. A large part of the social sciences has been interested in the different forms of mobility, from a wide variety of spatial and temporal scales. This book presents the different spatial and temporal scales of mobility and the way in which they form a system, by associating them with essential and original research objects. It provides an in-depth review of scientific knowledge, a perspective on major societal issues, analytical tools and a discussion on the main current academic debates. The authors highlight the need to take into account both the spatial and temporal scales of mobility in order to address contemporary environmental and societal issues. The book invites us to think about the entanglement of these different scales from the analysis of rhythms by founding a rhythmology of contemporary mobilities.

| Sommario/riassunto | This book presents a new perspective on the interaction between word-order and grammaticalisation by investigating the changes that stylistic fronting and oblique subjects have undergone in Romance (Catalan, French, Spanish) as compared to Germanic (English, Icelandic). It discusses a great deal of historical comparative data showing that stylistic fronting and oblique subjects have (had) a semantic effect in the Germanic and in the Romance languages, and that they both appear in the same functional category. The loss of stylistic fronting and oblique subjects is seen as an effect of grammaticalisation, where grammaticalisation is taken to be a regular case of parameter change. In contrast to previous and recent approaches to grammaticalisation, however, the author shows that it is not the loss of morphology that |

triggers grammaticalisation with subsequent word-order changes, but that the word-order change sets off grammaticalisation in the functional categories, which is then followed by the loss of morphology.
