Sommario/riassunto

This book, edited by Vivek P. Chavda, provides a comprehensive overview of nanocarrier vaccines, focusing on the fast-track development of these innovative solutions in immunology. It covers the history, types, and properties of nanoparticles, as well as their applications in vaccine delivery. The book delves into the advantages of using nanoparticles as vaccine carriers, exploring various types such as liposomes, polymer-based nanoparticles, and virus-like particles. Additionally, it addresses the synthesis, formulation, and characterization of nanoparticles, along with the potential risks associated with nanotoxicity. The text is targeted at researchers, professionals, and students in the fields of pharmacy, biotechnology, and nanotechnology, aiming to equip them with the knowledge to advance in vaccine development and nanoparticle technology.
