| Sommario/riassunto | Blue Biotechnology is an open access, peer-reviewed journal featuring studies that cover all areas of applied research and biotechnology involving marine microorganisms (microalgae, bacteria and fungi), algae and invertebrates. Aspects of basic biological research, such as evolution, phylogeny and taxonomy, ecology and metagenomics, cellular and molecular biology, are considered only when they are relevant to biotechnology and support translational research. The vision for Blue Biotechnology is to contribute to the advancement of blue bioeconomy and the sustainable management and protection of oceans, fisheries, and coastal and marine environments. |
