Sommario/riassunto	Workers who are involuntarily displaced from their jobs can face long periods of unemployment. Wages also tend to be lower once they find a new job, especially when they are unable to find a new job in the same occupation as their pre-displacement job or in occupations using similar skills. Helping displaced workers back into work quickly and minimising the income losses they face is therefore an important challenge for employment policy. This series of reports provides new empirical evidence from a comparative perspective on the incidence of displacement and the risk displaced workers subsequently face of a long spell of unemployment and large wage losses when re-employed. It also identifies the main labour market programmes providing help to these workers and assesses how adequate and effective they are. Policy recommendations for further action are presented. Nine countries are participating in the review: Australia, Canada, Denmark, Finland, Japan, Korea, New Zealand, Sweden and the United States.
