Sommario/riassunto

Football is the world's most popular sport. It is a cultural phenomenon and a global media spectacle. For its billions of fans, it serves as a common language. But where does its enduring popularity come from? Featuring essays from prominent experts in the field, scholars and journalists, this Companion covers ground seldom attempted in a single volume about football. It examines the game's oft-disputed roots and traces its development through Europe, South America and Africa, analysing whether resistance to the game is finally beginning to erode in China, India and the United States. It dissects the cult of the manager and how David Beckham redefined sporting celebrity. It investigates the game's followers, reporters and writers, as well as its most zealous money makers and powerful administrators. A valuable resource for students, scholars and general readers, The Cambridge Companion to Football is a true and faithful companion for anyone fascinated by the people's game.

Sommario/riassunto	The 1991 Persian Gulf War was considered a brief and successful military operation with few injuries and deaths. A large number of returning veterans, however, soon began reporting health problems

that they believed to be associated with their service in the gulf. Under a Congressional mandate, the Institute of Medicine (IOM) is reviewing a wide array of biologic, chemical, and physical agents to determine if exposure to these agents may be responsible for the veterans' health problems. In a 2000 report, Gulf War and Health, Volume 1: Depleted Uranium, Sarin, Pyridostigmine Bromide, and Vaccines, the IOM concluded that there was not enough evidence to draw conclusions as to whether long-term health problems are associated with exposure to depleted uranium, a component of some military munitions and armor. In response to veterans' ongoing concerns and recent publications in the literature, IOM updated its 2000 report. In this most recent report, Gulf War and Health: Updated Literature Review of Depleted Uranium, the committee concluded that there is still not enough evidence to determine whether exposure to depleted uranium is associated with long-term health problems. The report was sponsored by the U.S. Department of Veterans Affairs.
