Sommario/riassunto	<p>In this standard, a protocol is defined that provides precise synchronization of clocks in packet-based networked systems. Synchronization of clocks can be achieved in heterogeneous systems that include clocks of different inherent precision, resolution, and stability. The protocol supports synchronization accuracy and precision in the sub-microsecond range with minimal network and local computing resources. Customization is supported by means of profiles. The protocol includes default profiles that permit simple systems to be installed and operated without the need for user management. Sub-nanosecond time transfer accuracy can be achieved in a properly designed network.</p>

Sommario/riassunto	The themes chosen for study in this volume are deeply embedded within the respective structures of phenomenology and pragmatism, though often implicitly so. Each of the six chapters begins with the phenomenological perspective and then proceeds to the pragmatic focus. The intent of each chapter is both to provide increased clarity in understanding each of the two positions and to reveal the basic philosophic rapport between them. Such a recognized rapport in turn adds to the insightful understanding of each position, at times opening up new possibilities for the expansion or deepening of a par
