La crise du Covid-19 a exacerbé et mis au grand jour les difficultés du système de santé français, notamment sur le volet de la gestion des ressources humaines : pénuries de personnel, épuisement professionnel, rémunérations insuffisantes... Beaucoup de territoires connaissent déjà ces maux : les déserts médicaux ne datent pas d'hier, pas plus que les problèmes de coordination des soins pour la prise en charge des maladies chroniques ou les lacunes en termes d'accompagnement au grand âge. Tous ces problèmes ne viennent pas de la formation et tous ne trouvent pas leur solution dans les réformes conduites dans ce domaine, mais la façon dont l'appareil de formation délivre les connaissances et fabrique les spécialités, son organisation (entre les universités, les CHU, les facultés, les instituts... et les territoires), les politiques en matière d'admission et de flux d'étudiants (les fameux *numerus clausus* et quotas), tout cela façonne le système de santé, influe sur les possibilités de coopération et les conflits et modèle le rapport à l'innovation et la distribution des ressources sur le terrain. Si la santé est un bien commun, la réforme des études est l'affaire de tous. Ce livre, qui donne la parole aux acteurs (enseignants, professionnels de santé, chercheurs, étudiants et acteurs des politiques), place les réformes actuelles des études de santé à la portée du plus grand nombre.

Sommario/riassunto

Hauptbeschreibung According to Frank Appel, CEO of Deutsche Post DHL, within its Strategy 2015 framework, DHL will "become the logistics company for the world". In times of globalization and economic downturn, the effects of which can be felt in the entire logistics industry, this goal is an enormous challenge for DHL. In order to attain this goal, it is essential for DHL to create a closer linkage of its business areas, to slim down its processes and to put a stronger focus on the ever-changing needs of the customer. The objective of this book is to offer cost reduction sol

Sommario/riassunto	<p>“The Contrast”, which premiered at New York City's John Street Theater in 1787, was the first American play performed in public by a professional theater company. The play, written by New England-born, Harvard-educated, Royall Tyler was timely, funny, and extremely popular. When the play appeared in print in 1790, George Washington himself appeared at the head of its list of hundreds of subscribers. Reprinted here with annotated footnotes by historian Cynthia A. Kierner, Tyler's play explores the debate over manners, morals, and cultural authority in the decades following American Revolution. Did the American colonists' rejection of monarchy in 1776 mean they should abolish all European social traditions and hierarchies? What sorts of etiquette, amusements, and fashions were appropriate and beneficial? Most important, to be a nation, did Americans need to distinguish themselves from Europeans-and, if so, how? Tyler was not the only American pondering these questions, and Kierner situates the play in its broader historical and cultural contexts. An extensive introduction provides readers with a background on life and politics in the United States in 1787, when Americans were in the midst of nation-building. The book also features a section with selections from contemporary letters, essays, novels, conduct books, and public documents, which debate issues of the era.</p>

Sommario/riassunto	<p>The title follows from the original demonstration by Dr. Hugh de Wardener in 1961 that a humoral agent is produced after extracellular volume expansion which results in a vigorous diuresis and natriuresis. Thus the name of "natriuretic hormone" was coined. In the years that followed several investigators pursued the search for the hormone. What resulted, however, was the discovery of several hormones with different characteristics, all of which were natriuretic. Initially it was found that the hormone was similar in action to ouabain or digoxin, hence the appellation of ouabain-like or digoxin-like. The hormone was found to be an inhibitor of Na-K-ATPase, which would fit with it being a cardiotonic steroid. On the other hand, neither ouabain or digoxin migrated on Sephadex gel filtration in the same locus as the hormone. Other investigators claim to have identified the hormone-initially as a vanadium-diascorbate, later as bufadienolides such as marinobufagenin, yet later as a macrocylic derivative of inorganic carbon suboxide with a molecular weight of 408 Da. Some support for the latter finding was derived from an earlier report that a semi-purified Sephadex-derived compound was found to have a molecular weight of about 12,000 Da but the active compound, when split from its carrier protein, had a molecular weight of exactly 408 Da. This compound had not been further identified. As further development was the demonstration by Bricker and colleagues that a natriuretic substance could be purified from uremic urine. This turned out to be a</p>

xathurenic acid derivative. Meanwhile the focus began to turn to natriuretic peptides derived from heart (ANF and BNP). These peptides have a shorter duration of action than the cardiotonic steroid-like hormone and ANF has proved to be most useful as a measure of heart failure. It should also be stressed that marinobufagenin, like ANF, is elevated in congestive heart failure, whereas the steroid-like hormone is depressed or absent in this state. This review will attempt to describe and contrast the properties of each of the proposed natriuretic hormones, including their locus on Sephadex separation, potency, duration of action, chemical structure (if known), behavior in hypertension, renal failure, heart failure, and brain disease. As most recent work has focussed on marinobufagenin, this hormone will be brought up to date by investigators in the field.

Sommario/riassunto

For the public at large Shi'ism often implies a host of confused representations, suggesting more often than not obscurantism, intolerance, political violence and other ignominies running hot or cold in response to world events. In fact for many people, Shi'ism stands for "radical Islam", or - worse - "Islamic terrorism". In some respects, nothing is more familiar than Shi'ism, and yet nothing is more misunderstood. For some twenty years the media have increased their coverage of the phenomenon. Never, or only rarely, do they formulate the question we ask here: what is Shi'ism? What is this belief that inspires millions of people dispersed throughout the world? This book provides a broad based introduction to Shi'i Islam. It examines what the Shi'i believe, how they see themselves and how they view the world. It includes a thorough examination of doctrine, philosophy, the Shi'i approach to the Qur'an and the historical evolution of Shi'ism as a branch of Islam. Too often, and too quickly, the conclusion is drawn that Shi'ism is a marginal heretical sect, fundamentally alien to the deeper truth of the great religion of Islam, thrust by historical accident onto the political stage. Shi'ism either speaks the truth of Islam, meaning that it is a truth of terror, or it is entirely foreign to Islam and, therefore, merits outright rejection, as Islamic fundamentalists and some individuals repeatedly claim. This book intends to explain why such common misunderstandings of Shi'ism have taken root. Written in an accessible format and providing a thorough overview of Shi'ism, this book will be an essential text for students and scholars of Islamic Studies or Iranian Studies.

Sommario/riassunto	<p>Olfaction and taste are of critical importance to insects and other animals, since vital behaviours, including mate, food and host seeking, as well as predator and toxin avoidance, are guided by chemosensory cues. Mate and habitat choice are to a large extent determined by chemical signals, and chemoreceptors contribute accordingly to pre-mating isolation barriers and speciation. In addition to fundamental physiological, ecological and evolutionary consideration, the knowledge of insect taste and especially olfaction is also of great importance to human economies, since it facilitates a more informed approach to the management of insect pests of agricultural crops and forests, and insect vectors of disease. Chemoreceptors, which bind to external chemical signals and then transform and send the sensory information to the brain, are at the core of the peripheral olfactory and gustatory system and have thus been the focus of recent research in chemical ecology. Specifically, emphasis has been placed on functional characterization of olfactory receptor genes, which are derived from three large gene families, namely the odorant receptors, gustatory receptors and ionotropic receptors. Spatial expression patterns of olfactory receptors in diverse chemosensory tissues provide information on divergent functions, with regards to ecologically relevant behaviours. On the other hand, characterization of olfactory receptor activation profiles, or "deorphanization", provides complimentary data on the molecular range of receptivity to the</p>

fundamental unit of the olfactory sense. The aim of this Research Topic is to give an update on the breadth and depth of research currently in progress related to understanding the molecular mechanisms of insect chemoreception, with specific emphasis on the olfactory receptors.
