Sommario/riassunto

Despite recent progress, malnutrition remains a severe problem in Ethiopia, especially among young children. Many of them suffer lifelong consequences in terms of higher risk of mortality and future illness, impaired cognitive ability (including lower IQ) and educational attainment, and overall productivity loss. This report provides the findings from an in-depth data-based analysis of malnutrition in Ethiopia and its causes. It assesses various aspects of current nutrition programming in the country, noting the importance of Ethiopia's first National Nutrition Strategy and National Nutrition
