Sommario/riassunto	The monograph "Determinants of logistics in the era of sustainable development of enterprises" is a thorough analysis of the key factors influencing logistics at a time when sustainable development is becoming a priority for modern enterprises. Faced with increasing environmental pressures and changes in global supply chains, companies must adapt their logistics strategies to minimize their environmental impact while remaining competitive. The authors present the complex relationships between business activities and the environment, pointing out the benefits that may result from implementing pro-ecological solutions. Modern approaches such as green logistics, reverse logistics and circular supply chains are discussed, which are playing an increasingly important role in efficiently managing resources and minimizing waste. The publication also contains an overview of innovative technologies that can revolutionize logistics infrastructure, as well as the role of pro-ecological activities in the processes of globalization and urbanization. It is a must-read for managers, logisticians and everyone who cares about running their business in accordance with the principles of sustainable development while maintaining high operational efficiency.
