	Pubbl/distr/stampa	[Place of publication not identified], : IWA Publishing, 2010
	ISBN	1-68015-577-6
	Collana	KWR Watercycle Research Institute series Elimination of micro-organisms by drinking water treatment processes
	Disciplina	613.287
	Soggetti	Drinking water - Microbiology - Netherlands Water - Purification - Netherlands Drinking water - Purification - Netherlands Civil & Environmental Engineering Engineering & Applied Sciences Environmental Engineering
	Lingua di pubblicazione	Inglese
	Formato	Materiale a stampa
	Livello bibliografico	Monografia
	Note generali	Bibliographic Level Mode of Issuance: Monograph

The overall aim of this book is to present default values for the micro-organisms elimination or inactivation credit of universally used processes in water treatment (MEC or MIC). The growing interest in Quantitative Microbial Risk assessment (QMRA) for safe drinking water requires such data. These MEC or MIC values have been calculated from research on elimination of viruses, bacteria and bacterial spores and protozoa (oo)cysts (Cryptosporidium and Giardia) by these treatment processes published in the international literature. The data have been selected on the base of different quality criteria related to information on applied experimental conditions and used methods. Furthermore the studies have been categorized on base of their similarities with 'real world' conditions (selected micro-organisms, scale and conditions of the tested processes).
