Sommario/riassunto

This contributed volume presents eco-imagination as a new tool for knowledge and cultural, artistic, as well as scientific expression. Herein eco-phenomenology becomes capable of opening a viable path towards a future of environmental and human sustainability. The contemporary urgency of sustainable configurations of the world and of life has made clear the inadequacy of the traditional phenomenological conception of imagination, understood in the mere relationship with perception. These chapters verify the ecological potential of the imagination, thanks to which the latent virtualities in the processes of self-individualization that constitute evolving life become visible. The book collectively argues that only if we use the eco-imagination can one introduce new forms of design thinking needed, since they are intrinsic to the onto-poietic progression of the logos of life. This volume appeals to students and researchers in phenomenology and related fields.
