

1. Record Nr.	UNISA996418165403316
Autore	Nakagiri Kota
Titolo	Search for the Decay $K_L \rightarrow \nu \bar{\nu}$ at the J-PARC KOTO Experiment <a href="#">[[electronic resource] /]</a> / by Kota Nakagiri
Pubbl/distr/stampa	Singapore : , : Springer Singapore : , : Imprint : Springer, , 2020
ISBN	981-15-6422-1
Edizione	[1st ed. 2020.]
Descrizione fisica	1 online resource (XVI, 151 p. 121 illus., 109 illus. in color.)
Collana	Springer Theses, Recognizing Outstanding Ph.D. Research, , 2190-5053
Disciplina	539.72162
Soggetti	Nuclear physics Heavy ions Particle acceleration Elementary particles (Physics) Quantum field theory Nuclear Physics, Heavy Ions, Hadrons Particle Acceleration and Detection, Beam Physics Elementary Particles, Quantum Field Theory
Lingua di pubblicazione	Inglese
Formato	Materiale a stampa
Livello bibliografico	Monografia
Nota di contenuto	Introduction -- The KOTO Experiment -- Data Taking -- Event Reconstruction -- Monte Carlo Simulation -- Analysis of the $KL0$ and $KL0X0$ Searches -- Discussion -- Conclusion -- Appendix.
Sommario/riassunto	This book reports on a new result from the $KL0$ search at the J-PARC KOTO experiment, which sets an upper limit of $3 \times 10^{-9}$ for the branching fraction of the decay at the 90% confidence level, improving the previous best limit by an order of magnitude. To explain the matter–antimatter asymmetry in the universe, still unknown new physics beyond the standard model (SM) that breaks CP symmetry is necessary. The rare decay of a long-lived neutral K meson, $KL0$ , is a CP-violating decay. It is an excellent probe to search for new physics because new physics can contribute to the decay and change its branching fraction, while the SM is as small as $3 \times 10^{-11}$ . However, it is extremely difficult to search for because all of the decay products are neutral and two neutrinos are undetectable. The $KL0$ signal is

identified by measuring two photons from a 0 with a calorimeter and confirming the absence of any other detectable particles with hermetic veto counters. The book contributes to the analysis of neutron-induced backgrounds which were the dominant background sources in the search. For the background caused by two consecutive hadronic showers in the calorimeter due to a neutron, the author evaluated the background yield using a data-driven approach. For another background caused by an meson production— decays two photons—by a neutron that hits a veto counter near the calorimeter, the author developed an original analysis technique to reduce it. The book also contributes to the analysis of the normalization modes (KL30, KL20, KL2) to measure KL yield, the estimation of the signal acceptance based on a simulation, and the evaluation of the trigger efficiency. As a result, significant improvements in the measurement were achieved, and this is an important step in the continuing higher sensitivity search, which can reach new physics with the energy scales up to O(100-1000 TeV).

2. Record Nr.	UNIORUON00158269
Autore	OKURA Nagatsune
Titolo	Koeki kokusan ko / Okura Nagatsune ; Tsuchiya Takao kotei
Pubbl/distr/stampa	Tokyo, : Iwanami shoten, 1977
Descrizione fisica	336 p. ; 15 cm
Classificazione	GIA SERIE
Soggetti	AGRICOLTURA - GIAPPONE - ORIGINI-1800
Lingua di pubblicazione	Giapponese
Formato	Materiale a stampa
Livello bibliografico	Monografia
