| Autore | Dai Yanan |
| Titolo | Imaging Light with Photoelectrons on the Nano-Femto Scale // by Yanan Dai |
| Pubbl/distr/stampa | Cham : , : Springer International Publishing : , : Imprint : Springer, , 2020 |
| ISBN | 3-030-52836-7 |
| Edizione | [1st ed. 2020.] |
| Descrizione fisica | 1 online resource (XV, 115 p. 77 illus., 68 illus. in color.) |
| Collana | Springer Theses, Recognizing Outstanding Ph.D. Research, , 2190-5053 |
| Disciplina | 537.56 |
| Soggetti | Spectrum analysis
Microscopy
Chemistry, Physical and theoretical
Lasers
Photonics
Optical materials
Electronics - Materials
Spectroscopy and Microscopy
Theoretical and Computational Chemistry
Optics, Lasers, Photonics, Optical Devices
Optical and Electronic Materials |
| Lingua di pubblicazione | Inglese |
| Formato | Materiale a stampa |

Livello bibliografico	Monografia
Nota di contenuto	Chapter1: Introduction -- Chapter2: Experimental Methods -- Chapter3: Simulation Framework -- Chapter4: Propagating Surface Plasmon Polaritons (SPPs) -- Chapter5: Spin Angular Momenta and Chirality of SPPs -- Chapter6: Plasmon Orbital Angular Momentum Generation -- Chapter7: Summary and Perspectives.
Sommario/riassunto	This thesis presents significant advances in the imaging and theory of the ultrafast dynamics of surface plasmon polariton fields. The author details construction of a sub-10 femtosecond and sub-10 nanometer spatiotemporal resolution ultrafast photoemission microscope which is subsequently used for the discovery of topological meron and skyrmion-like plasmonic quasiparticles. In particular, this enabled the creation of movies of the surface plasmon polariton fields evolving on sub-optical wavelength scales at around 0.1 femtosecond per image frame undergoing vortex phase evolution. The key insight that the transverse spin of surface plasmon polaritons undergoes a texturing into meron or skyrmion-like topological quasiparticles (defined by the geometric charge of the preparation) follows. In addition, this thesis develops an analytical theory of these new topological quasiparticles, opening new avenues of research, while the ultrafast microscopy techniques established within will also be broadly applicable to studies of nanoscale optical excitations in electronic materials.
