Sommario/riassunto

The increasing incidence of type II diabetes, often in association with cardiovascular disease, constitutes one of the major healthcare challenges of the 21st century. However, physicians can now deploy a wide range of therapeutic agents, singly and in combination, to help lower and stabilise blood sugar levels. Drawing on the expertise of internationally-recognised authorities in their fields, this new volume describes the modes of action of each of these types of treatment and evaluates their effectiveness. In the first section of the book the authors review the various agents used to manage
