Sommario/riassunto	This thesis presents a revolutionary technique for modelling the dynamics of a quantum system that is strongly coupled to its immediate environment. This is a challenging but timely problem. In particular it is relevant for modelling decoherence in devices such as quantum information processors, and how quantum information moves between spatially separated parts of a quantum system. The key feature of this work is a novel way to represent the dynamics of general open quantum systems as tensor networks, a result which has connections with the Feynman operator calculus and process tensor approaches to quantum mechanics. The tensor network methodology developed here has proven to be extremely powerful: For many situations it may be the most efficient way of calculating open quantum dynamics. This work is abounds with new ideas and invention, and is

likely to have a very significant impact on future generations of physicists.

Sommario/riassunto	Adopting an international perspective, the essays in this volume look at

the motives, methods and impact of enforcing the Protestant Reformation in Ireland and Scotland. The volume offers a fascinating insight into how the political authorities in Scotland and Ireland attempted, with varying degrees of success, to impose Protestantism on their countries. By comparing the two situations and placing them in the wider international picture, our understanding of European confessionalization is further enhanced.
