Sommario/riassunto	This Festschrift volume has been published in honor of Ed Brinksma, on the occasion of his 60th birthday. The contributions in this Festschrift are written by a number of Ed's former Ph.D. students and collaborators. The papers are a reflection on his research contributions and interests and all fall into the area of formal methods, or in Ed's terminology applied mathematics in computer science. The papers address modeling languages and semantics, model-based testing,

verification and performance analysis, probabilistic computation, system dynamics, and applications of formal methods.

Sommario/riassunto	In the field of image processing, many applications require real-time execution, particularly those in the domains of medicine, robotics and transmission, to name but a few. Recent technological developments have allowed for the integration of more complex algorithms with large data volume into embedded systems, in turn producing a series of new sophisticated electronic architectures at affordable prices. This book performs an in-depth survey on this topic. It is primarily written for those who are familiar with the basics of image processing and want to implement the target processing design using different electronic platforms for computing acceleration. The authors present techniques and approaches, step by step, through illustrative examples. This book is also suitable for electronics/embedded systems engineers who want to consider image processing applications as sufficient imaging algorithm details are given to facilitate their understanding.
