We tend to hold people responsible for their choices, but not for what they can't control: their nature, genes or biological makeup. This thought-provoking collection redefines the boundaries of moral responsibility. It shows how epigenetics reveals connections between our genetic makeup and our environment. The essays challenge established notions of human nature and the nature/nurture divide and suggest a shift in focus from individual to collective responsibility. Uncovering the links between our genetic makeup, environment and experiences, this is an important contribution to ongoing debates on ethics, genetics and responsibility.
