	Collana	Africae Monographs
	Soggetti	Urban Studies South Africa Johannesburg urban policies urban development transport network
	Lingua di pubblicazione	Inglese
	Formato	Materiale a stampa
	Livello bibliografico	Monografia

After two decades of significant change, Johannesburg has been expanding and undergoing deep restructuring. Today, the city is going through an unprecedented development phase, initiated by new territorial dynamics resulting from urban policies, resident practices and market trends. While Johannesburg aims to become a “World Class African City”, as a part of managing its growth it is essential to offer an accurate image of its strengths and weaknesses. The issue of urban resilience has become central to the discourse on cities and calls for light to be shed on the evolutions that have shaped and continue to shape the city of Johannesburg. In this light, we focus on major urban phenomena including: The spatial evolution of the city where densification is not always synonymous with urbanity; Increasing spatial differentiations according to population and housing; Increasingly fragmented and extensive spatial structuring. In this publication, special attention has been given to the compilation of former and recent data. These data, depending on objective geographic elements, show how “various cities” exist within the city. Overcoming the limitations of the data was the main difficulty. Urban evolutions are rapid, but existing data are difficult to access and are often out of date or localised, as part of unsuitable divisions. Various comments have been written to shed light on the maps and facilitate their reading. The objective of this work is to create a coherent set of maps so as to offer a homogeneous vision of the city and urbanisation processes underlining it.
