2. Record Nr.	UNINA9910454944003321
Titolo	Solvent effects and chemical reactivity [[electronic resource] /] / edited by Orlando Tapia and Juan Bertran
Pubbl/distr/stampa	Dordrecht ; ; Boston, : Kluwer Academic Publishers, c1996
ISBN	1-280-20541-5 9786610205417 0-306-46931-6
Edizione	[1st ed. 2002.]
Descrizione fisica	1 online resource (390 p.)
Collana	Understanding chemical reactivity ; ; v. 17
Altri autori (Persone)	TapiaOrlando <1938-> BertranJ <1931-> (Juan)
Disciplina	541.3/4
Soggetti	Reactivity (Chemistry) Solution (Chemistry) Solvation Solvents Electronic books.
Lingua di pubblicazione	Inglese
Formato	Materiale a stampa
Livello bibliografico	Monografia
Note generali	Description based upon print version of record.
Nota di bibliografia	Includes bibliographical references and index.
Nota di contenuto	Continuum Solvation Models -- Theoretical Basis for the Treatment of Solvent Effects in the Context of Density Functional Theory -- Monte Carlo Simulations of Chemical Reactions in Solution -- Computer Simulation for Chemical Systems: from Vacuum to Solution -- Crossing the Transition State in Solution -- Valence Bond Multistate Approach to Chemical Reactions in Solution -- Quantum Theory of Solvent Effects and Chemical Reactions.
Sommario/riassunto	This book gathers original contributions from a selected group of distinguished researchers that are actively working in the theory and practical applications of solvent effects and chemical reactions. The importance of getting a good understanding of surrounding media effects on chemical reacting system is difficult to overestimate. Applications go from condensed phase chemistry, biochemical reactions <i>in vitro</i> to biological systems <i>in vivo</i> . Catalysis is a phenomenon produced by a particular system interacting with the reacting subsystem. The result may be an increment of the chemical

rate or sometimes a decreased one. At the bottom, catalytic sources can be characterized as a special kind of surrounding medium effect. The materials involving in catalysis may range from inorganic components as in zeolites, homogenous components, enzymes, catalytic antibodies, and ceramic materials. . With the enormous progress achieved by computing technology, an increasing number of models and phenomenological approaches are being used to describe the effects of a given surrounding medium on the electronic properties of selected subsystem. A number of quantum chemical methods and programs, currently applied to calculate in vacuum systems, have been supplemented with a variety of model representations. With the increasing number of methodologies applied to this important field, it is becoming more and more difficult for non-specialist to cope with theoretical developments and extended applications. For this and other reasons, it is was deemed timely to produce a book where methodology and applications were analyzed and reviewed by leading experts in the field.
