

1. Record Nr.	UNISALENTO991003321879707536
Autore	Istat
Titolo	Lettura Mass Media e Linguaggio : anni 1987-91 / Sistema Statistico Nazionale, Istituto nazionale di Statistica
Pubbl/distr/stampa	[Roma] : Istat, 1993
Descrizione fisica	338 p. ; 28 cm.
Collana	Indagine multiscopo sulle famiglie ; 7
Disciplina	028.0945021
Soggetti	Istat Letture - Italia - dati statistici
Lingua di pubblicazione	Italiano
Formato	Materiale a stampa
Livello bibliografico	Monografia
2. Record Nr.	UNINA9911020059803321
Autore	Bersuker I. B (Isaak Borisovich)
Titolo	Electronic Structure and Properties of Transition Metal Compounds : Theory and Applications
Pubbl/distr/stampa	Newark : , : John Wiley & Sons, Incorporated, , 2025 ©2025
ISBN	1-394-17892-1 1-394-17891-3 1-394-17890-5
Edizione	[3rd ed.]
Descrizione fisica	1 online resource (865 pages)
Altri autori (Persone)	LiuYang
Disciplina	546.6
Soggetti	Transition metal compounds
Lingua di pubblicazione	Inglese
Formato	Materiale a stampa
Livello bibliografico	Monografia

Cover -- Title Page -- Copyright Page -- Contents -- Preface to the Third Edition -- Extract from the Preface to the Second Edition -- Extracts from the Preface to the First Edition -- Foreword to the First Edition -- Mathematical Symbols -- Abbreviations -- Chapter 1 Introduction: Subject and Methods -- 1.1 Objectives -- 1.1.1 Molecular Engineering and Intuitive Guesswork -- 1.1.2 Main Objectives of This Book in Comparison with Other Sources -- 1.2 Definitions of Chemical Bonding and Transition Metal Coordination System -- 1.2.1 Chemical Bonding as an Electronic Phenomenon -- 1.2.2 Definition of Coordination System -- 1.3 The Schrödinger Equation -- 1.3.1 Formulation -- 1.3.2 Role of Approximations -- Summary Notes -- References -- Chapter 2 Atomic States -- 2.1 One-Electron States -- 2.1.1 Angular and Radial Functions -- 2.1.2 Orbital Overlaps: Hybridized Functions -- 2.1.3 Spin-Orbital Interaction -- 2.1.4 Relativistic Atomic Functions -- 2.2 Multielectron States: Energy Terms -- 2.2.1 Electronic Configurations and Terms -- 2.2.2 Multielectron Wavefunctions -- 2.2.3 Slater-Condon and Racah Parameters -- 2.2.4 The Hartree-Fock Method -- Summary Notes -- Questions -- Exercises and Problems -- References -- Chapter 3 Symmetry Ideas and Group-Theoretical Description -- 3.1 Symmetry Transformations and Matrices -- 3.2 Groups of Symmetry Transformations -- 3.3 Classification of Point Groups -- Example 3.1. The Symmetry Group of an Octahedral Oh System and Its Classes -- 3.4 Representations of Groups and Matrices of Representations -- Example 3.2. The Rules of IrReps and Characters in C_{4v} Point Group -- 3.5 Classification of Molecular Terms and Vibrations, Selection Rules, and The Wigner-Eckart Theorem -- Example 3.3. Energy Terms of Electronic Configuration e² -- 3.6 Construction of Symmetrized Molecular Orbitals and Normal Vibrations. Example 3.4. Construction of E_g-Symmetry-Adapted s MOs for Octahedral Oh Systems -- Example 3.5. Construction of T_{2g}-Symmetry-Adapted p MOs for Octahedral Oh Systems -- Example 3.6. Normal Coordinates of a Regular Triangular Molecule X₃ -- 3.7 The Notion of Double Groups -- Summary Notes -- Exercises and Problems -- References -- Chapter 4 Crystal Field Theory -- 4.1 Introduction -- 4.1.1 Brief History -- 4.1.2 Main Assumptions -- 4.2 Splitting of the Energy Levels of One d Electron in Ligand Fields -- 4.2.1 Qualitative Aspects and Visual Interpretation -- 4.2.2 Calculation of the Splitting Magnitude -- Example 4.1. Splitting of a d-Electron Term in Octahedral Crystal Fields -- 4.2.3 Group-Theoretical Analysis -- 4.3 Several d Electrons -- 4.3.1 Case of a Weak Field -- 4.3.2 Strong Crystal Fields and Low- and High-Spin Complexes -- Example 4.2. High-Spin and Low-Spin Octahedral Complexes of Iron -- 4.3.3 Energy Terms of Strong-Field Configurations -- 4.3.4 Arbitrary Ligand Fields and Tanabe-Sugano Diagrams -- 4.4 f-Electron Term Splitting -- 4.5 Crystal Field Parameters and Extrastabilization Energy -- 4.6 Limits of Applicability of Crystal Field Theory -- Summary Notes -- Questions -- Exercises and Problems -- References -- Chapter 5 Molecular Orbitals and Related Description of Electronic Structure -- 5.1 Basic Ideas of the MO LCAO Method -- 5.1.1 Main Assumptions -- 5.1.2 Secular Equation -- 5.1.3 Classification by Symmetry -- 5.1.4 Symmetrized Orbitals -- 5.1.5 Simplification of the Secular Equation -- 5.1.6 A Short Note on Band Structure of Transition Metal Solids -- 5.2 Charge Distribution and Bonding in the MO LCAO Method. The Case of Weak Covalency -- 5.2.1 Atomic Charges and Bond Orders -- Example 5.1. Shortcomings of Mulliken's Definition of Atomic Charges in Molecules -- 5.2.2 Bonding, Nonbonding, and Antibonding Orbitals. 5.2.3 Case of Weak Covalency -- 5.2.4 Angular Overlap Model -- 5.3 Methods of Calculation of MO Energies and LCAO Coefficients -- 5.3.1

SCF MO LCAO Approximation -- 5.3.2 Electron Correlation Effects --
5.3.3 Basis Sets and Pseudopotentials -- EXAMPLE 5.2 Calculate the
CuF₂ Molecule Using Hartree-Fock and MP2 Methods -- Example 5.3.
Calculate the Absorption and Emission spectra of [Cr(ddpd)₂]³⁺ (ddpd
= N,N -dimethyl- N,N -dipyridin-2-ylpyridine-2,6-diamine) using
CASSCF and CASPT2 Methods -- 5.4 Density Functional Theory -- 5.4.1
Hohenberg-Kohn (HK) Method -- 5.4.2 Exchange-Correlation
Functional -- 5.4.3 Time-Dependent DFT (TD-DFT) -- 5.4.4 Density-
Functional Tight Binding (DFTB) -- Example 5.4. Calculation of ZnCl₂
by the DFT Method -- Example 5.5. DFT Calculation of the Energy of
Absorption of the O₂ on the Surface of CoN₄-ZnN₄/C Material -- 5.5
Electronic Structure Calculations for Large Polyatomic Systems -- 5.5.1
Fragmentary Calculations -- 5.5.2 Molecular Mechanics -- Example
5.6. Application of Molecular Modeling to Transition Metal Complexes
with Macrocycles -- 5.5.3 Combined Quantum/Classical (QM/MM)
Methods -- EXAMPLE 5.7 Oxidative Addition of H₂ to Pt(P(t-Bu)₃)₂
Treated by ONIOM Version of QM/MM Methods -- Example 5.8. Iron
Picket-Fence Porphyrin Treated by the QM/MM Method with Charge
Transfer (QM/MM/CT) -- 5.5.4 Machine Learning Force Fields (MLFF)
Method -- 5.6 Comparison of Methods and Computer Programs --
Summary Notes -- Exercises and Problems -- References -- Chapter 6
Electronic Structure and Chemical Bonding -- 6.1 Classification of
Chemical Bonds by Electronic Structure and Role of d and f Electrons in
Coordination Bonding -- 6.1.1 Criticism of the Genealogical
Classification -- 6.1.2 Classification by Electronic Structure and
Properties -- 6.1.3 Features of Coordination Bonds.
6.1.4 Coordination Bonding by Pre- and Post-transition Elements --
6.2 Qualitative Aspects and Electronic Configurations -- 6.2.1 Most
Probable MO Schemes -- 6.2.2 Electronic Configurations in Low- and
High-Spin Complexes -- 6.2.3 Covalence Electrons and Ionization
Potentials -- 6.3 Ligand Bonding -- 6.3.1 General Considerations:
Multiorbital Bonds -- 6.3.2 Mono-orbital Bonds: Coordination of NH₃
and H₂O -- Example 6.1. Ab Initio Numerical SCF CI Calculations of the
Electronic Structure of Mono-orbital Bonds: Ni(H₂O)_n and Ni(PH₃)_n, n
= 1, 2 -- 6.3.3 Di-orbital Bonds: Coordination of the N₂ Molecule --
Example 6.2. Electronic Structure and Bonding in FeN₂ -- 6.3.4
Coordination of Carbon Monoxide -- Example 6.3. Bonding and Charge
Transfer in the Pt-CO Complex -- Example 6.4. Bonding in M-CO with
M = Cr, Fe, Co, Ni -- Example 6.5. Bonding in Sc-CO, Ni-CO, and Ni
(CO)₂ -- 6.3.5 + Bonding -- Example 6.6. Electronic Structure of
Transition Metal Hexacarbonyls M(CO)₆ -- 6.3.6 CO Bonding on
Surfaces -- 6.3.7 Bonding of NO -- Example 6.7. Coordination of NO
on the Ni(111) Surface -- 6.3.8 Coordination of C₂H₄ -- Example 6.8.
Ethylene Bonding to Transition Metal Centers -- Example 6.9. Ethylene
Bonding in PtCl₃(C₂H₄)- and PdCl₃(C₂H₄)- -- 6.3.9 Metal-Metal Bonds
and Bridging Ligands -- Example 6.10. Multiple Metal-Metal Bonds in
[Re₂Cl₈]²⁻ and [Mo₂Cl₈]⁴⁻ -- 6.4 Energies, Geometries, and Charge
Distributions -- 6.4.1 Ionization Energies -- Example 6.11. Ab Initio
Calculations of Ni(C₃H₅)₂ -- 6.4.2 Total and Bonding Energies,
Geometries, and Other Properties -- 6.5 Relativistic Effects -- 6.5.1
Relativistic Approaches -- 6.5.2 Orbital Contraction and Valence
Activity -- Example 6.12. Relativistic Effects in Catalytic Activity of Pt
and Pd Complexes -- 6.5.3 Bond Lengths, Bond Energies, and
Vibrational Frequencies.
Example 6.13. Relativistic Effects in Metal Hydrides -- 6.5.4 Correlation
Between Spin-Orbital Splitting and Bonding -- Example 6.14.
Relativistic Semiempirical Calculation of PtCl₆²⁻ -- 6.5.5 Other
Relativistic Effects -- Summary Notes -- Exercises and Problems --

References -- Chapter 7 Vibronic Coupling in Formation, Deformation, and Transformation of Polyatomic Systems. The Jahn-Teller Effects -- 7.1 Molecular Vibrations -- 7.1.1 Adiabatic Approximation -- 7.1.2 Normal Coordinates and Harmonic Vibrations -- 7.1.3 Special Features of Vibrations of Coordination Compounds -- 7.2 Vibronic Coupling -- 7.2.1 Vibronic Constants -- 7.2.2 Orbital Vibronic Constants -- Example 7.1. Vibronic MO Description of Electronic Structure of N₂ and CO -- 7.3 The Jahn-Teller Effects -- 7.3.1 The Jahn-Teller Theorem -- 7.3.2 The Pseudo-Jahn-Teller Effect -- 7.3.3 Hidden-Jahn-Teller and Hidden Pseudo-Jahn-Teller Effects. Four Modifications of Jahn-Teller Effects -- Example 7.2. Hidden-JTE Origin of Instability of the High-Symmetry Configuration of the Ozone Molecule -- 7.3.4 Configurations with h-PJTE and Spin Crossover -- Example 7.3. Hidden-PJTE Origin of Instability of the High-Symmetry Configuration of the CuF₃ Molecule -- 7.3.5 The Renner-Teller Effect -- 7.3.6 The Jahn-Teller Effect in a Twofold-Degenerate Electronic State -- 7.3.7 Threefold-Degenerate Electronic States -- 7.4 Pseudo-Jahn-Teller Effect and the Two-Level Paradigm -- 7.4.1 Pseudo-Jahn-Teller (PJT) Instability -- 7.4.2 Uniqueness of the Vibronic Mechanism of Structural Configuration Instability. The Two-Level Paradigm -- Example 7.4. Numerical Confirmation of the Pseudo-Jahn-Teller Origin of Instability of High-Symmetry Configurations of Simple Molecules -- Example 7.5. Numerical Calculations Confirming the Pseudo-Jahn-Teller Origin of Configuration Instability of Coordination Systems. 7.4.3 Further Insight into the Pseudo-JTE and Hidden JTE.

Sommario/riassunto

"Transition metals commonly refers to 40 chemical elements (21-30, 39-48, 71-80, and 103-112) which represent the transition between group 2 and group 13 elements, are solids at room temperature (except mercury), tend to have high tensile strength, density, and melting and boiling points. Distinguished from pure metallic state with electronic band structures, transition metal elements form a large variety of coordination compounds with an incomplete d-electron subshell leading to different oxidation states, and other special properties. They form also coordination centers in a wide range of atomic formations including important metallo-biochemical centers, activation states of chemical reactions, and serve as good homogeneous or heterogeneous catalysts. Areas of applications of transition metal compounds are innumerable"--
