Sommario/riassunto	In Australia, as in many comparable democracies, the role of the media in the political process is high on the public agenda. There is a perception of widespread disillusionment with and disengagement from politics amongst voters, and criticism of the media for failing to fulfil their democratic responsibilities adequately. This book evaluates public perceptions of the performance of the political media in the context of the declared aims and objectives of media producers. From there the authors present findings for improving the capacity of political media to engage and inform their audiences in ways which enhance the quality and popular legitimacy of the democratic process. These conclusions are of import not only to Australians, but to observers of mediated politics in the UK, the US and other countries where similar debates around the 'crisis of public communication' are on-going.

reference will be the first book focused entirely on the unique engineering properties of residual soil. Given the predominance of residual soils in the under-developed parts of the United States and the Southern Hemisphere, and the increasing rate of new construction in these regions, the understanding of residual soils is expected to increase in importance in the coming years. This book will be written for the practicing geotechnical engineer working to any degree with residual soils. It will describe the unique properties of residual soil and provide innovative design techniques for building on it safely. The author will draw on his 30 years of practical experience as a practicing geotechnical engineer, imbuing the work with real world examples and practice problems influenced by his work in South America and Southeast Asia"--
